It’s not about IBS or Crohn’s disease. It’s not about lactose, gluten or a myriad of other food allergies. These are simply the symptoms of a much bigger problem – Leaky Gut Syndrome, or G.I. dysbiosis. Pain medications, steroids, and antibiotics only exacerbate the problem, and although elimination diets, amino acids and antioxidants may relieve some symptoms, the root problem still remains. Leaky Gut Syndrome, compounded by an overgrowth of pathogenic gut bacteria, puts us on the path to chronic inflammation, autoimmune conditions, and certain death from some types of infections. The most elementary of solutions is thus, to heal the leaky gut and eliminate the harmful gut bacteria.

Colostrum is nature’s most basic and effective “medicine.” The growth factors, particularly epithelial growth factor, in colostrum heal leaky gut and the immunoglobulins destroy pathogenic bacteria. Healing the barrier between the G.I. tract and the bloodstream is quintessential to restoring health. When immunoglobulins cause bacteria to die off, the dead bacteria are full of toxins, which if left to cross the G.I./bloodstream barrier, create an immune system super-storm, leading to massive inflammation and tissue damage. So, if a colostrum supplement does not contain both immunoglobulins and growth factors, there is little value in taking it. Moreover, unlike antibiotics, colostrum does not create superbugs. Bovine colostrum is more powerful than human colostrum, and when it is properly processed, micro-encapsulated with a liposomal delivery method, and verified to contain growth factors and immunoglobulins, it truly becomes “nature’s healing miracle.”

Learning Objectives:

- Understand the etiology of chronic disease, autoimmune diseases, allergies, and aging as it relates to Leaky Gut Syndrome and imbalance in the gut microbiome
- Understand the role of bovine colostrum in the healing/prevention of Leaky Gut Syndrome
- Understand the importance of colostrum sourcing, processing, and verification testing in the production of an efficacious colostrum supplement
- Understand the significance of liposomal delivery to the bioavailability of colostrum’s healing components

ABOUT THE SPEAKER:

Douglas Wyatt is the founder of Sovereign Laboratories LLC, a Sedona-based company dedicated to developing natural products that provide the public with the best solutions for optimal health. He is honored to be listed as the leading expert in colostrum and is credited with reintroducing bovine colostrum into human use. Mr. Wyatt is also a leader in the research and proponent of colostrum’s unique and powerful healing components that show incredible promise for turning the tide on the prevention and treatment of the world’s increasing chronic disease epidemic. Mr. Wyatt is dedicated to the prevention of chronic disease through natural nutritional intervention and is working with the World Health Organization and other internationally recognized research organizations on clinical trials on HIV/AIDS other infectious diseases, auto immune diseases, and bowel health issues.

Douglas A. Wyatt is also the Director of Research for the Center for Nutritional Research, a not-for-profit research institute dedicated to nutritional health. Mr. Wyatt was responsible for numerous innovations critical to bovine colostrum production, delivery and survivability in human use, and enhanced performance. He pioneered reforms in colostrum collection procedures, including a requirement that all colostrum come only from certified healthy, hormone, antibiotic and pesticide-free, pasture-fed cows that is minimally processed. This insures all of colostrum’s unique life giving components not only survive but are biologically active. To ensure that colostrum would make it into the G1 tract, Mr. Wyatt developed a means to provide a special liposomal coating process that protects the colostrum components so they can survive the stomach passage intact and improve their absorption into the blood stream for significantly enhanced performance.
